

UltraLock™

By WINFIELD
UNITED

Adjuvant

TRULY ALL-PURPOSE DRIFT AND DEPOSITION ADJUVANT

Achieve exceptional weed control across many crop protection systems, including dicamba, 2,4-D, glyphosate, and more with one product.

Derived from crop-based oil, UltraLock™ considerably reduces the number of fine particles in the spray pattern without thickening the spray.

Extensive wind-tunnel testing with fine and ultra-coarse nozzles, tank-mix compatibility tests, and field research confirms that UltraLock™ provides a single solution for all your DRT and DRA needs.

Drift Reduction &
Approved DRA*

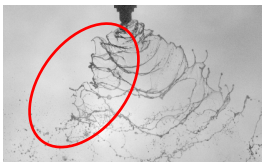

Features & Benefits

- Helps **reduce re-sprays and drift complaints** through a new patent-pending formulation that reduces fine particles and delivers more droplets in the ideal droplet diameter.
- Supports **better weed control and higher yield potential** by improving deposition and coverage – studies at our Innovation Center prove that UltraLock provides enhanced leaf coverage.
- Helps **fight herbicide resistance** by enhancing canopy depth which delivers more active ingredients to their target.

Use Rate

- For general drift reduction (5-25 gallons/acre): 4 oz per acre
- For use as a DRA for dicamba applications*
 - Engenia® & Tavium®: 4 oz/acre
 - XtendiMax®: 6 oz/acre

Without UltraLock many dicamba spray patterns are susceptible to cross-wind deformations which lead to increased drift

UltraLock resists this deformation and results in a more uniform spray pattern and fewer driftable fines.
